EXECUTIVE SUMMARY

Section 303(d) of the Clean Water Act and the U.S. Environmental Protection Agency's Water Quality Planning and Management Regulations (Title 40 of the *Code of Federal Regulations* Part 130) require states to identify waterbodies that are not meeting water quality standards and to develop total maximum daily loads (TMDLs) of pollutants for those waterbodies. A TMDL establishes the amount of a pollutant that a waterbody can assimilate without exceeding its water quality standard for that pollutant. TMDLs provide the scientific basis for a state to establish water quality-based controls to reduce pollution from both point and nonpoint sources in order to restore and maintain the quality of the state's water resources (USEPA 1991).

A TMDL for a given pollutant and waterbody is composed of the sum of individual wasteload allocations (WLAs) for point sources and load allocations (LAs) for nonpoint sources and natural background levels. In addition, the TMDL must include an implicit or explicit margin of safety (MOS) to account for the uncertainty in the relationship between pollutant loads and the quality of the receiving waterbody. The TMDL components are illustrated using the following equation:

$$TMDL = \sum WLAs + \sum LAs + MOS.$$

This fecal coliform TMDL has been developed for Big Silver Creek, which is in the Pearl River Basin in southeastern Louisiana. Big Silver Creek flows for 19 miles from its headwaters to the Bogue Chitto River.

The fecal coliform TMDL for Big Silver Creek was calculated using a load duration curve approach. The load duration curve methodology illustrates allowable loading at a wide range of streamflow conditions. The steps for applying the methodology were (1) developing a flow duration curve; (2) converting the flow duration curve to load duration curves; (3) plotting observed loads with load duration curves; (4) calculating the TMDL, MOS, WLA, and LA; and (5) calculating percent reductions. Most fecal coliform bacteria TMDLs are developed on a seasonal basis (i.e., calculating allowable loads and percent reductions for both summer and winter) because of the state's seasonal water quality criteria.

The reductions for fecal coliform bacteria at the monitoring station on Big Silver Creek are 90 percent during the winter and 98 percent in the summer (Table ES-1).

Table ES-1. Summary of fecal coliform bacteria TMDL for Big Silver Creek

Season	TMDL (MPN/day)	WLA (MPN/day)	LA (MPN/day)	Explicit MOS (MPN/day)	Percent reduction
Winter	3.19E+12	8.30E+07	2.55E+12	6.37E+11	90%
Summer	3.44E+11	8.30E+07	2.75E+11	6.88E+10	98%

Note: MPN = most probable number.

1. Introduction

Section 303(d) of the Clean Water Act and the U.S. Environmental Protection Agency's (EPA's) Water Quality Planning and Management Regulations (Title 40 of the *Code of Federal Regulations* [CFR] Part 130) require states to develop total maximum daily loads (TMDLs) of pollutants for waterbodies that are not supporting their designated uses, even if pollutant sources have implemented technology-based controls. A TMDL establishes the maximum allowable load (mass per unit of time) of a pollutant that a waterbody is able to assimilate and still support its designated uses. The maximum allowable load is determined on the basis of the relationship between pollutant sources and in-stream water quality. A TMDL provides the scientific basis for a state to establish water quality-based controls to reduce pollution from both point and nonpoint sources in order to restore and maintain the quality of the state's water resources (USEPA 1991).

A TMDL for a given pollutant and waterbody is composed of the sum of individual wasteload allocations (WLAs) for point sources and load allocations (LAs) for nonpoint sources and natural background levels. In addition, the TMDL must include an implicit or explicit margin of safety (MOS) to account for the uncertainty in the relationship between pollutant loads and the quality of the receiving waterbody. The TMDL components are illustrated using the following equation:

$$TMDL = \sum WLAs + \sum LAs + MOS.$$

This fecal coliform TMDL has been developed for Big Silver Creek, which is in the Pearl River Basin in southeastern Louisiana (Figure 1-1). Big Silver Creek flows for 19 miles from its headwaters to the Bogue Chitto River.

In 1996, Big Silver Creek was identified as threatened on the state's section 303(d) list of impaired waterbodies because of turbidity from pastureland, silviculture, and surface mining. The state's 2002 303(d) list show subsegment 090502 as not supporting its designated use of primary contact recreation because of total fecal coliform (LDEQ 2003). The 2004, 2006, and the draft 2008 editions of the *Louisiana Water Quality Inventory: Integrated Report (Integrated Report)* show Big Silver Creek as not supporting its designated use of primary contact recreation because of fecal coliform bacteria from an unknown source (LDEQ 2005, 2007a, 2008). Fecal coliform data from 2006 and 2009 support the current use impairment listing for primary contact recreation and also show violations of the secondary contact recreation criterion for Big Silver Creek.

The fecal coliform TMDL for Big Silver Creek was calculated using a load duration curve approach. The load duration curve methodology illustrates allowable loading at a wide range of streamflow conditions. The steps for applying the methodology were (1) developing a flow duration curve; (2) converting the flow duration curve to load duration curves; (3) plotting observed loads with load duration curves; (4) calculating the TMDL, MOS, WLA, and LA; and (5) calculating percent reductions. Most fecal coliform TMDLs are developed on a seasonal basis (i.e., calculating allowable loads and percent reductions for both summer and winter) because of the state's seasonal water quality criteria.

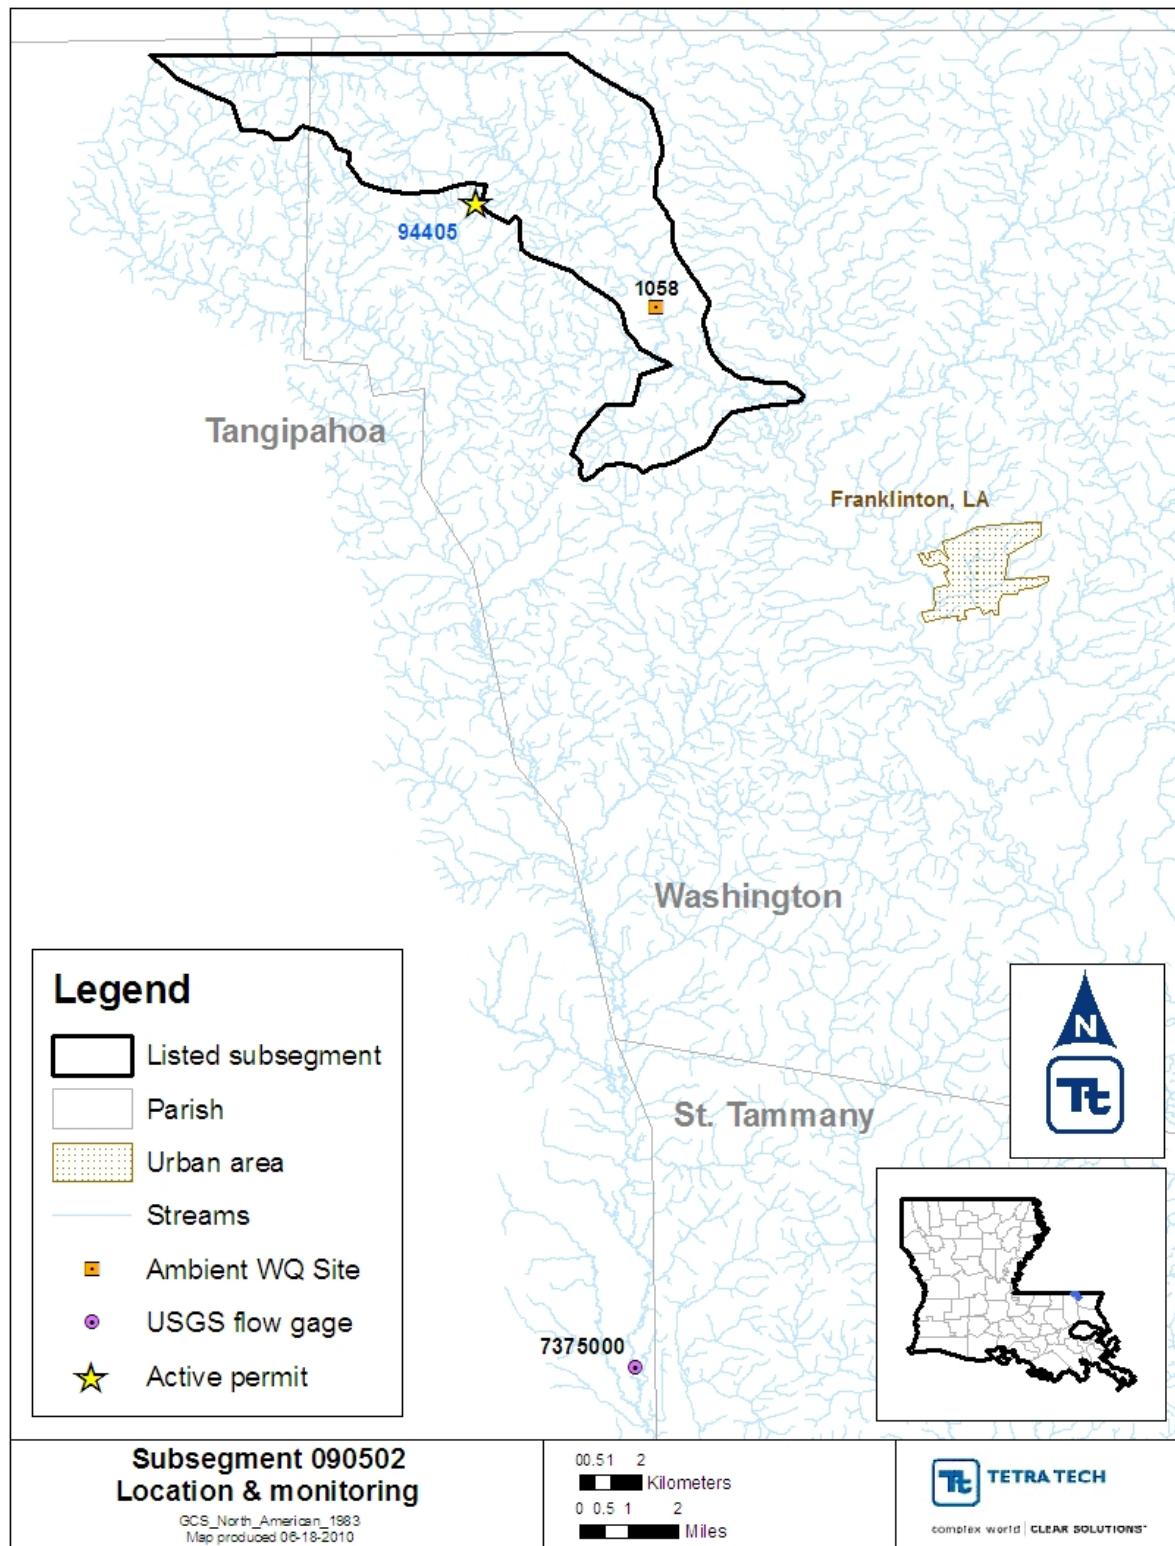

Figure 1-1. Big Silver Creek (subsegment 090502) location and monitoring.

2. Study Area Description

2.1 Pearl River Basin—Big Silver Creek

This fecal coliform TMDL has been developed for Big Silver Creek, which is in the Pearl River Basin in southeastern Louisiana (Figure 1-1). Big Silver Creek flows for 19 miles from its headwaters to the Bogue Chitto River. The Pearl River Basin lies along the southeastern Louisiana–southwestern Mississippi border. The basin is bordered on the north by the Mississippi state line and on the west and south by the Lake Pontchartrain Basin. Elevations in the Pearl River Basin range from 350 feet above mean sea level in the northwest portion to sea level at the southern end. Correspondingly, the vegetation varies from pine forests to brackish marsh.

The 2004, 2006, and the draft 2008 *Integrated Reports* show the primary contact recreation designated use not being supported and fecal coliform listed as the reason for the impairment of this subsegment. The sources of the fecal coliform bacteria are unknown (LDEQ 2005, 2007a, 2008).

A TMDL was developed for fecal coliform for seven subsegments of the Pearl River basin, including Big Silver Creek (Table 2-1) in December 2007 (FTN 2007). LDEQ historical water quality data at monitoring locations located in the subsegment were analyzed for long-term trends, seasonal patterns, and relationships between fecal coliform counts and stream flow. No historical trends, seasonal patterns or relationships with flow were apparent in these data. The TMDLs in this report were developed using the load duration curve methodology, consistent with the prior approach. Additional water quality and flow data were used in developing the current TMDL. This TMDL supersedes the previous TMDL.

Table 2-1. Summary of TMDLs for Fecal Coliform from the 2007 TMDL for Big Silver Creek

Season	TMDL (MPN/day)	WLA (MPN/day)	LA (MPN/day)	Explicit MOS (MPN/day)	Future growth (MPN/day)	Percent reduction
Winter	1.03E+15	8.33E+7	8.26E+14	1.03E+14	1.03E+14	90%
Summer	1.02E+14	8.33E+7	8.14E+13	1.02E+13	1.02E+13	60%

Note: MPN = most probable number.

Source: FTN 2007

Land use data from the 2001 National Land Cover Database (NLCD) were used in Table 2-2 and Figure 2-1. NLCD 2001 is a land-cover database composed of land cover, impervious surface, and canopy density data. NLCD 2001 uses improved classification algorithms, which result in data with more precise rendering of spatial boundaries between the 16 classes than those obtained using NLCD 1992 (USEPA 2007).

Table 2-2. Subsegment 090502 land use (NLCD 2001)

Land use	Percent
Open water	0.08%
Developed	4.37%
Barren land	0.04%
Forest	19.97%
Grass/shrub	20.36%
Pasture/hay	19.18%
Cultivated crops	13.63%
Woody wetlands	22.08%
Emergent herbaceous wetlands	0.30%

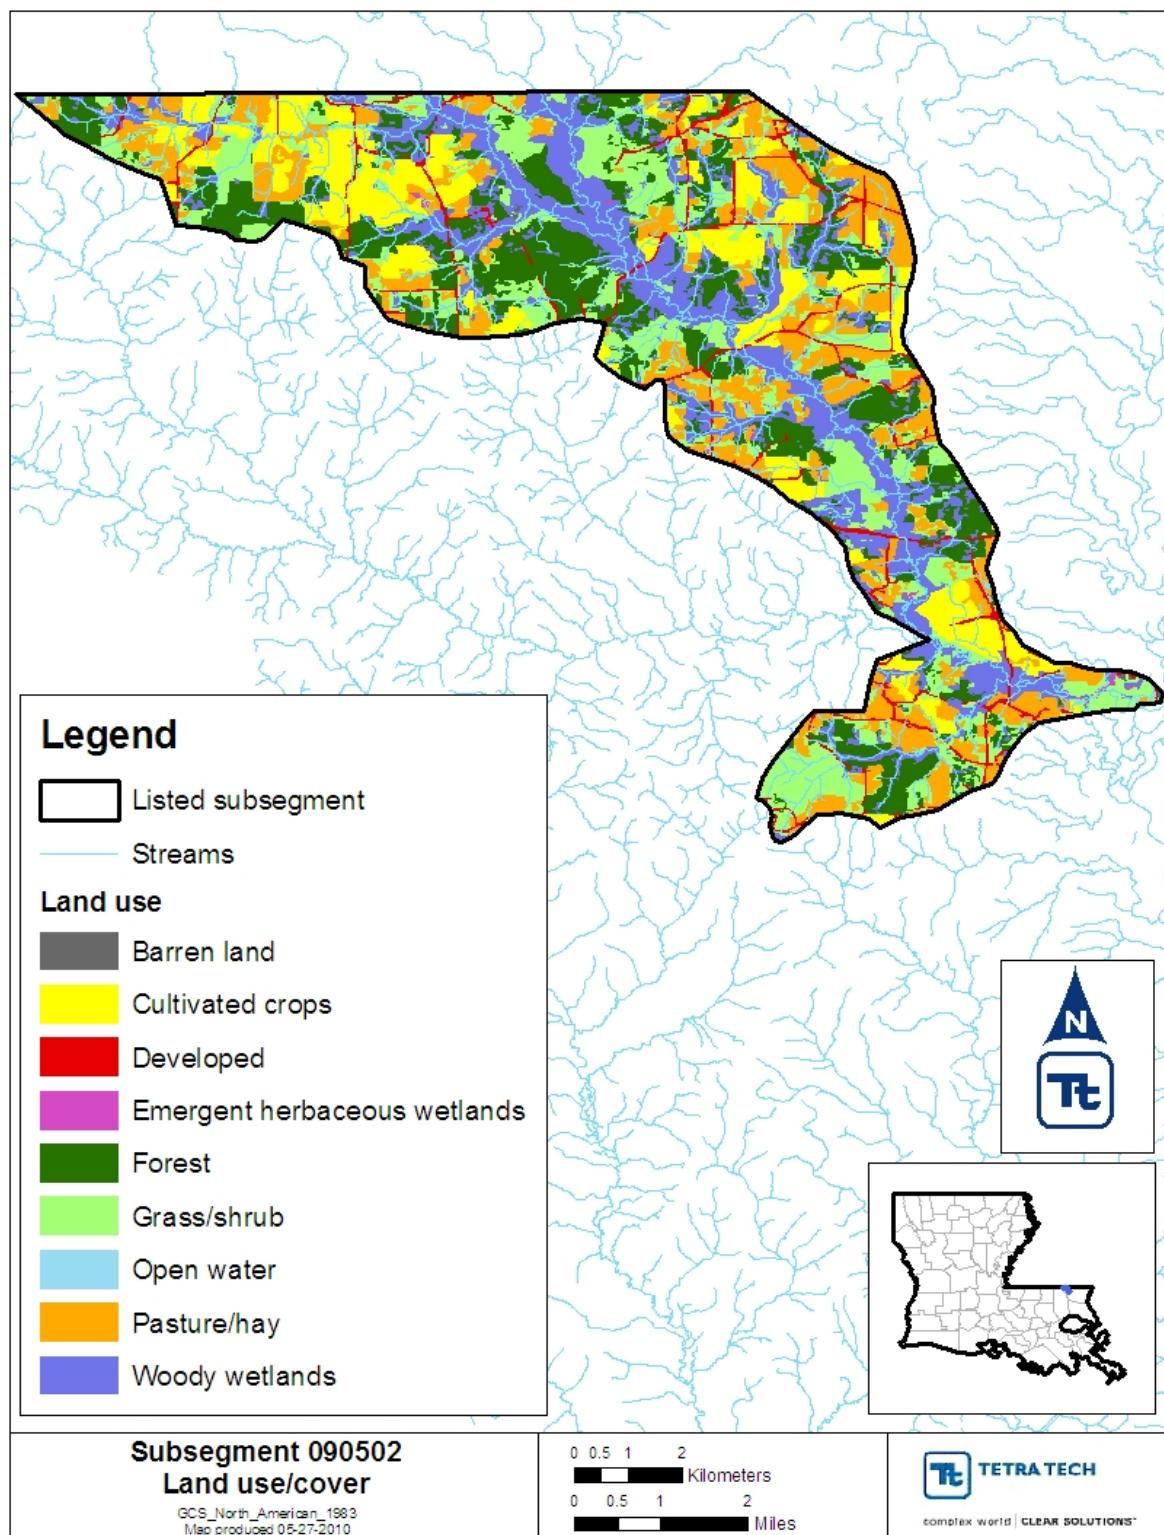

Figure 2-1. Land use in Big Silver Creek (subsegment 090502).

2.2 Water Quality Data

There is one water quality station on Big Silver Creek with fecal coliform data. Station 1058 (Big Silver Creek at Highway 38) had 24 fecal coliform observations collected in 2006, 2008, and 2009. Three fecal coliform observations collected at station 1058 exceeded the water quality criterion for primary contact recreation; the exceedances occurred in May, September, and October. Two of the fecal coliform observations exceeded the water quality criterion for secondary contact recreation; the exceedances occurred in January and March. Of the water quality samples collected after 2005, 12.5 percent exceeded the water quality criterion for primary contact recreation and 8.3 exceeded the water quality criterion for secondary contact recreation on Big Silver Creek. Appendix A contains the raw water quality data.

The fecal coliform data were plotted over time for subsegment 090502 (Figure 2-2). The exceedances occurred in January, March, May, September, and October. No distinct seasonal trends or patterns can be seen in the water quality data.

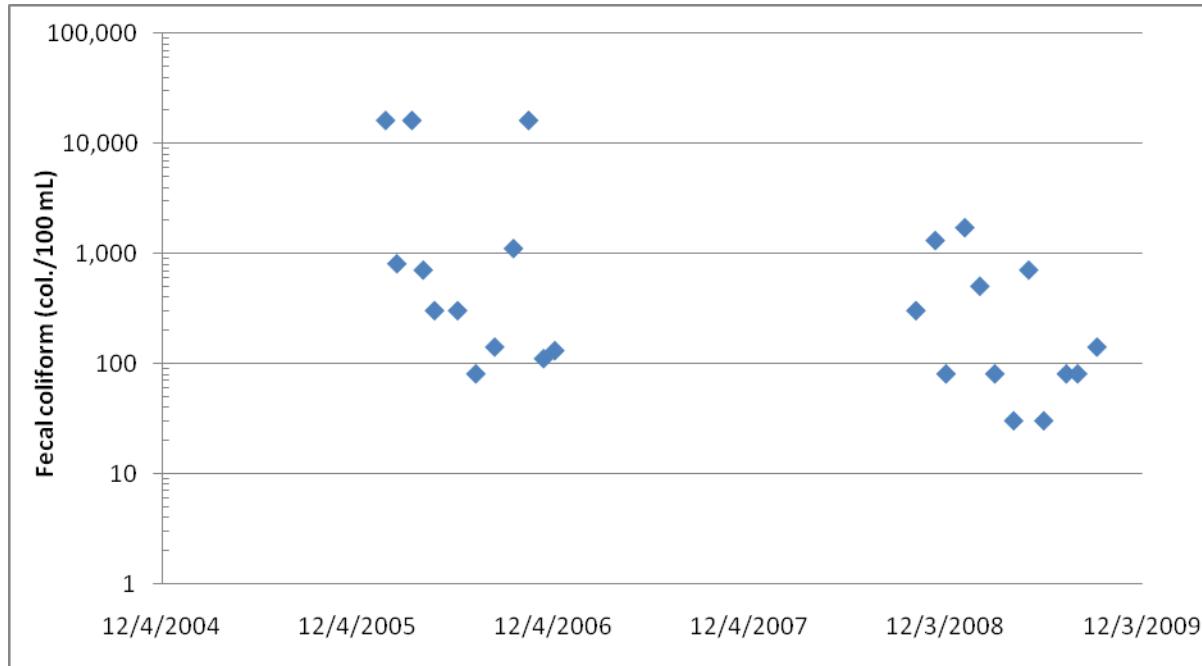

Figure 2-2. Fecal coliform data at Station 1058.

2.3 Water Quality Standards and Criteria

The designated uses for subsegment 090502 include primary contact recreation, secondary contact recreation, and propagation of fish and wildlife. Primary contact recreation includes any recreational or other water contact activity that involves prolonged or regular full-body contact with the water and in which the probability of ingesting appreciable amounts of water is considerable. Examples of that type of water use include swimming, water skiing, and diving (LDEQ 2007b). Secondary contact recreation includes any recreational or other water contact activity in which prolonged or regular full-body contact with the water is either incidental or accidental and the probability of ingesting appreciable amounts of water is minimal. Examples of that type of water use include fishing, wading, and boating (LDEQ 2007b). The criteria for protection of aquatic life are based on acute and chronic concentrations in fresh and marine waters and are developed primarily for attainment of the fish and wildlife propagation use.

Numeric criteria were used in conjunction with the assessment methodology presented in the Louisiana Department of Environmental Quality's (LDEQ) 305(b) report (LDEQ 2005) to list impaired subsegments. The LDEQ assessment methodology specifies that for primary contact recreation no more than 25 percent of the total samples collected on a monthly or near-monthly basis may exceed a fecal coliform density of 400/100 milliliters (mL). The primary contact recreation criterion applies only during the defined recreational period of May 1 through October 31. During the non-recreational period of November 1 through April 30, the criterion for secondary contact recreation applies. For secondary contact recreation, no more than 25 percent of the total samples collected on a monthly or near-monthly basis may exceed a fecal coliform density of 2,000/100 mL. The secondary contact recreation criterion applies year-round (LDEQ 2007b).

The Louisiana water quality standards also include an antidegradation policy (*Louisiana Administrative Code* Title 33, Part IX, Section 1109.A), which states that state waters exhibiting high water quality should be maintained at that high level of water quality. If that is not possible, water quality of a level that supports the designated uses of the waterbody should be maintained. The designated uses of a waterbody may be changed to allow a lower level of water quality only through a use attainability study. LDEQ has developed this TMDL to be consistent with the state's antidegradation policy (LDEQ 2000).

2.4 Flow

There are no active U.S. Geological Survey (USGS) flow-monitoring gages or other known flow gages in subsegment 090502. Flow for Big Silver Creek was calculated on the basis of the USGS station at Tchefuncta River near Folsom (07375000). Information from the USGS gage is summarized in Table 2-3.

Table 2-3. USGS flow gage information

Station number	Station name	Drainage area (mi ²)	Minimum date	Maximum date	Minimum flow (cfs)	Average flow (cfs)	Maximum flow (cfs)
07375000	Tchefuncta River near Folsom	95.5	10/1/1943	05/01/2010	26	158.36	15,100

2.5 Identification of Sources

Louisiana's draft 2008 *Integrated Report* states that the suspected nonpoint sources of the fecal coliform bacteria impairment in Big Silver Creek, subsegment 090502, are unknown (LDEQ 2008). A previously developed TMDL indicated that dairy farms may be contributing to the fecal coliform exceedances in Big Silver Creek, specifically along the western edge of Washington Parish and partially in Tangipahoa Parish (FTN 2007).

Overflows in sanitary sewer lines or major upsets at wastewater treatment plants can be related to poor maintenance in collection system interceptor lines (infiltration and inflow or line clogging), equipment failures at lift stations, or to inadequate pretreatment programs (LDEQ 2005). Municipal point sources include pollution introduced from end-of-pipe discharges from publicly owned treatment works.

Information on point source dischargers in the subsegment was obtained from LDEQ files. According to the LDEQ discharger database, one permitted facility is discharging to subsegment 090502 (Table 2-4).

Table 2-4. Summary of LPDES permits in subsegment 090502

AI #	Permit #	Outfall	Facility name	Exp. Date	Facility type	Outfall type	Receiving waterbody
94405	LAG541177	001	Mt Hermon School	06/05/13	Educational Services	treated sanitary wastewater	Silver Creek to Bogue Chitto River

3. TMDL Load Calculations

A TMDL is the total amount of a pollutant that can be assimilated by the receiving waterbody while still achieving water quality standards. In TMDL development, allowable loadings from all pollutant sources that cumulatively amount to no more than the TMDL must be established and thereby provide the basis for establishing water quality-based controls.

A TMDL for a given pollutant and waterbody is composed of the sum of individual WLAs for point sources and LAs for nonpoint sources and natural background levels. In addition, the TMDL must include an implicit or explicit MOS to account for the uncertainty in the relationship between pollutant loads and the quality of the receiving waterbody. The TMDL components are illustrated using the following equation:

$$TMDL = \sum WLAs + \sum LAs + MOS.$$

TMDLs are typically expressed as a mass loading (e.g., pounds per day).

Both section 303(d) of the Clean Water Act and the regulations at 40 CFR 130.7 require that TMDLs include an MOS to account for uncertainty in the available data or in the actual effect that controls will have on the loading reductions and receiving water quality. The MOS may be expressed explicitly as unallocated assimilative capacity or implicitly using conservative assumptions in establishing the TMDL. For a more detailed discussion of the MOS, see Section 3.4.

3.1 Load Duration Curve Approach

The methodology used to determine the TMDL for the impaired subsegments in Big Silver Creek subsegment 090502 is the load duration curve. This TMDL represents a continuum of desired loads over all flow conditions, rather than a fixed, single value, because loading capacity varies as a function of the flow present in the stream. The basic elements of this procedure are documented on the Kansas Department of Health and Environment Web site (KDHE 2003). That method was used to illustrate the allowable loading for a wide range of flows. The steps for how the methodology was applied for the TMDL in this report are summarized as follows:

1. Develop a flow duration curve.
2. Convert the flow duration curve to a load duration curve for each impairment.
3. Plot observed loads with load duration curves.
4. Calculate TMDL, WLA, LA, and MOS.
5. Calculate percent reductions required to meet water quality standards.

Flow Duration Curve

A flow duration curve was developed for subsegment 090502. Detailed flow information for subsegment 090502 was not available. To determine flow, data from a nearby USGS gage (07375000), with a drainage area of 95.5 square miles, was chosen to represent flow, and only the flows from 1980 and later were used. Flow from that gage was area-weighted to represent the flow from the TMDL subsegment. Subsegment 090502 has an area of 30 square miles.

Daily streamflow measurements were sorted in increasing order, and the percentile ranking of each flow was calculated. The daily streamflow measurements were separated into summer (May through October) and winter (November through April) data sets to accommodate the state's seasonal fecal coliform bacteria criteria. The load duration methodology requires that the same flow period be used for both developing the flow duration and calculating observed loads from sampling data. For each season, the flows were then plotted against the corresponding percent flow that exceeds a specific flow to create the flow duration curves.

Figure 3-1 is the flow duration curve for the summer months (May through October). The plot shows the flow (in cubic feet per second) on the Y-axis. The X-axis shows the percentage of days on which the plotted flow is exceeded. Points at the lower end of the plot (0 through 10 percent) represent high-flow conditions where only 0 through 10 percent of the flow exceeds the plotted point. Conversely, points on the high end of the plot (90 to 100 percent) represent low-flow conditions.

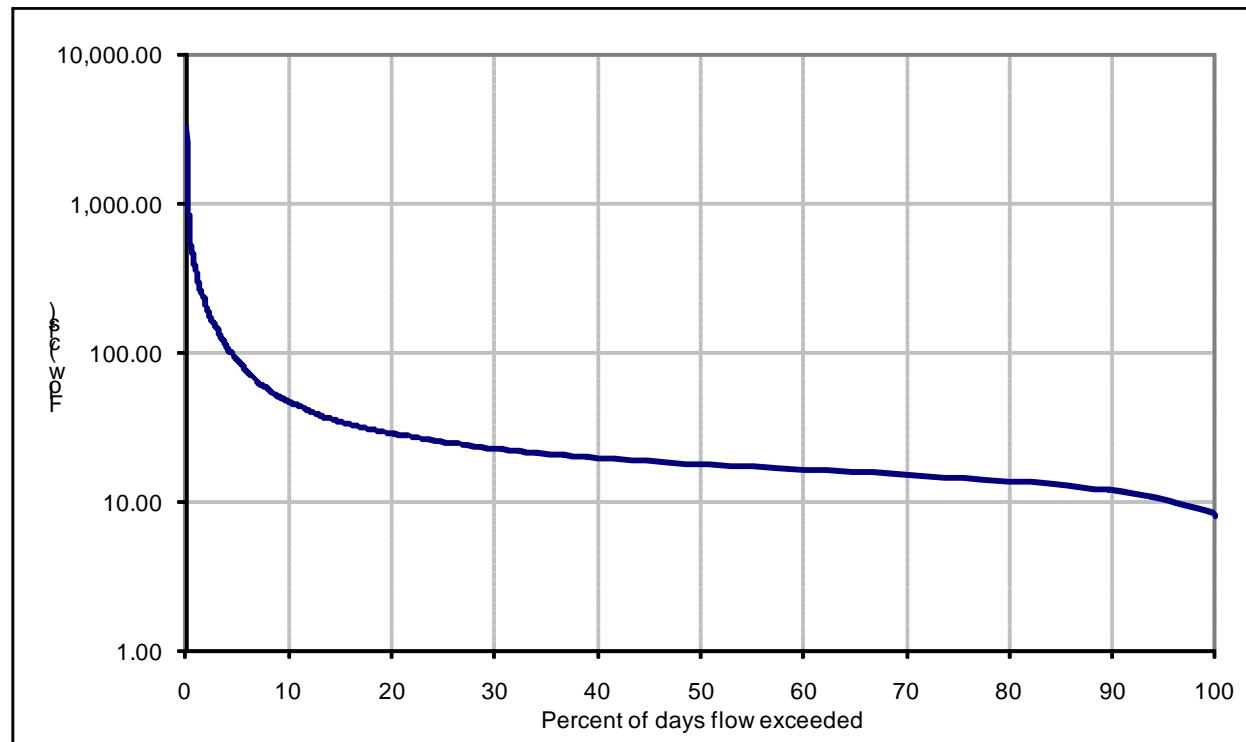

Figure 3-1. Summer flow duration curve for gage 07375000.

Load Duration Curve

The flows from the flow duration curves were multiplied by the appropriate target concentration (Section 2.3) for each season to compute an allowable load duration curve. Each load duration curve is a plot of organism count per day versus the percent flow exceedance from the flow duration curves.

The load duration curve is beneficial when analyzing monitoring data with their corresponding flow information plotted as a load. That approach allows the monitoring data to be placed in relation to their place in the flow continuum. Assumptions of the probable source or sources of the impairment can then be made from the plotted data. The load duration curve shows the calculation of the TMDL at any flow rather than at a single critical flow. The official TMDL number is reported as a single

number, but the curve is provided to demonstrate the value of the acceptable load at any flow. That approach allows for analysis of load cases in the future for different flow regimes.

Observed Loads

For each sampling station and season, observed loads were calculated by multiplying the observed concentration of fecal coliform bacteria by the flow on the sampling day. The observed loads were then plotted versus the percent flow exceedance of the flow on the sampling day and placed on the same plot as the load duration curve. Reductions were applied to the observed loads for each parameter until its water quality criteria and allowable percent exceedance were met to obtain an overall percent reduction for each subsegment. Those plots are shown in Appendix B of this report. The data calculations are shown in Appendix C.

The plots provide visual comparisons between observed and allowable loads under different flow conditions. Observed loads that are plotted above the load duration curve represent conditions where observed water quality concentrations exceeded the target concentrations. Observed loads that are plotted below the load duration curve represent conditions where observed water quality concentrations were less than target concentrations (i.e., not exceeding water quality standards).

3.2 TMDL

Table 3-1 presents the TMDL and allocations for subsegment 090502. Only observed data from 2005 and after were used in this TMDL. The reductions for fecal coliform bacteria at the monitoring station on Big Silver Creek are 90 percent during the winter and 98 percent in the summer. WLAs are discussed in Section 3.3; LAs, in Section 3.4; and MOSSs, in Section 3.5.

Table 3-1. Summary of fecal coliform bacteria TMDL for Big Silver Creek

Season	TMDL (MPN/day)	WLA (MPN/day)	LA (MPN/day)	Explicit MOS (MPN/day)	Percent reduction
Winter	3.19E+12	8.30E+07	2.55E+12	6.37E+11	90%
Summer	3.44E+11	8.30E+07	2.75E+11	6.88E+10	98%

Note: MPN = most probable number.

3.3 Wasteload Allocation (WLA)

The WLA portion of the TMDL equation is the total loading of a pollutant that is assigned to point sources. The point source in subsegment 090502 includes sanitary wastewater. Table 3-2 lists the fecal coliform WLA for the point source facility identified in Section 2.5.

WLAs for fecal coliform bacteria were calculated using monthly average permit limits, when applicable. If a permit does not have a monthly average permit limit, the weekly average permit limit was used. The preferred facility flow was the facility design or expected flow. If neither was available, the average (expected or observed) flows were used to calculate the WLAs. The permit maximum flow was used if the permitted or average flow was not available. The permit maximum flow was usually the maximum flow covered by the specific type of general permit. For example, the Louisiana Pollution Discharge Elimination System Class II Sanitary General Permit covers facilities with flows of up to 25,000 gallons per day. The permit maximum flow sometimes was significantly greater than the expected flow, and therefore the permit maximum was used only when other flows were not available.

The equation for WLA calculation is:

$$\text{Flow (gallon/day)} \times \text{concentration (MPN/100 mL)} \times 3,785.412 \text{ mL/gallon} = \text{MPN/day.}$$

Table 3-2. WLA summary for subsegment 090502

AI #	Permit #	Outfall	Facility name	Outfall type	Flow type	Flow (gpd)	FCB limit type ¹	Limit (MPN/100 mL)	Load (MPN/d)
94405	LAG541177	001	Mt Hermon School	treated sanitary wastewater	expected	10,960	weekly ave.	400	1.66E+08
							monthly ave.	200	82,976,255

¹ Individual WLAs are calculated using the most stringent limit. Other limits and loads are presented for the reader's information only.

LPDES permitted discharges without fecal coliform effluent limitations have been determined to not be sources of fecal coliform. For these dischargers, LDEQ is not providing allocations or permit limits. If at some point in the future, LDEQ determines that any of the discharges may contain fecal coliform, wasteload allocations may be provided along with the appropriate permit conditions.

3.4 Load Allocation (LA)

The LA is the portion of the TMDL assigned to natural background loadings, as well as nonpoint sources such as septic tank leakage, wildlife, and silvicultural and agricultural practices. The LA was calculated for this TMDL by subtracting the WLA and MOS from the total TMDL. LAs were not allocated to separate nonpoint sources because of a lack of available source characterization data. The LA is shown in Table 3-1.

3.5 Margin of Safety (MOS)

The Clean Water Act requires that TMDLs take into consideration a margin of safety. The MOS is the portion of the pollutant loading reserved to account for any uncertainty in the data. There are two ways to incorporate the MOS. One way is to implicitly incorporate it by using conservative model assumptions to develop allocations. The other way is to explicitly specify a portion of the TMDL as the MOS and use the remainder for allocations (USEPA 1991). For this TMDL, an explicit MOS of 20 percent was used; it is shown in Table 3-1.

3.6 Seasonal Variability and Critical Condition

The federal regulations at 40 CFR 130.7 require that TMDLs include seasonal variations and take into account critical conditions for streamflow, loading, and water quality parameters. For this TMDL, fecal coliform bacteria loadings for subsegments with primary contact recreation and secondary contact recreation as the designated uses were determined for winter and summer on the basis of seasonal water quality criteria, thus accounting for seasonality. In addition, the sampling results for all pollutants were plotted over time and reviewed for any seasonal patterns (see Section 2.2). The TMDL was developed over a several-year period, thereby accounting for seasonal variations.

The water quality criteria for fecal coliform bacteria include values that must not be exceeded more than 25 percent of the time (primary and secondary contact recreation) on the basis of the data sampled throughout the year, including during critical and noncritical conditions.

4. Monitoring Plan

LDEQ uses funds provided under section 106 of the Clean Water Act and under the authority of the Louisiana Environmental Quality Act to run a program for monitoring the quality of the state's surface waters. The LDEQ Surveillance Section collects surface water samples at various locations using appropriate sampling methods and procedures to ensure the quality of the data collected. The

objectives of the surface water monitoring program are to determine the quality of the state's surface waters, develop a long-term database for water quality trend analysis, and monitor the effectiveness of pollution controls. The data obtained through the surface water monitoring program are used to develop the state's biennial section 305(b) report (*Water Quality Inventory*) and the section 303(d) list of impaired waters. This information is also used to establish priorities for LDEQ's nonpoint source program.

LDEQ has implemented a watershed approach to surface water quality monitoring. Through this approach, the entire state is sampled on a 4-year cycle. Long-term-trend monitoring sites at various locations on the larger rivers and Lake Pontchartrain are sampled throughout the 4-year cycle. Sampling is conducted monthly to yield approximately 12 samples per site during each year the site is monitored. Sampling sites are located where they are considered representative of the waterbody. Within each basin, all monitored subsegments will be sampled over the year or years specified under each cycle period. Big Silver Creek was monitored with the Pearl River Basin in 2006, 2008, and 2009. Water quality assessments for the 305(b)/303(d) *Integrated Report* will be conducted for each basin following the last year of its monitoring period. Usually 125 waterbody subsegments are monitored each month under this program. Under the current monitoring schedule, approximately one-half of the state's waters are newly assessed for section 305(b) and section 303(d) listing purposes for each biennial cycle, with sampling occurring statewide each year. The 4-year cycle follows an initial 5-year rotation that covered all basins in the state according to the TMDL priorities. Monitoring allows LDEQ to determine whether any improvement has occurred in water quality after the TMDLs have been implemented. When LDEQ evaluates monitoring results at the end of each year, it may add waterbodies to or remove them from the section 303(d) list of impaired waterbodies.

5. Public Participation

Federal regulations require LDEQ to notify the public and seek comments concerning the TMDLs it prepares. This TMDL was developed under contract to LDEQ, and LDEQ will hold a public review period seeking comments, information, and data from the public and any other interested party. The notice for the public review period will be published in local and state newspapers and on LDEQ's electronic notification system. The TMDL report will be available on LDEQ's TMDL Web site at <http://www.deq.louisiana.gov/portal/default.aspx?tabid=1563>. The public review period will last for 30 days. LDEQ will review all comments received, and this TMDL might be revised to reflect comments if appropriate.”

Big Silver Creek at Hwy. 38	1058	9/9/09	140	

^a Data from before 2005 were not included in TMDL analysis.

Table A-2. Fecal coliform summary statistics for station 1058

Statistic	Value ^a
Minimum (MPN/100 mL)	30
Maximum (MPN/100 mL)	16,000
Average (MPN/100 mL)	2,361.67
Count	24
Percentage of data that violate the PCR criterion	12.5
Percentage of data that violate the SCR criterion	8.3

^a Data from before 2005 were not included in TMDL analysis.
